3 Trask Lane | Danvers | Massachusetts | 01923 | USA

For Research Use Only. Not for Use in Diagnostic Procedures.

**Applications:** Reactivity: Sensitivity: MW (kDa): Source: **UniProt ID:** Entrez-Gene Id: WB, IP, IF-IC HMRMk Endogenous 100 Rabbit #Q13263 10155

**Product Usage** Application Dilution Information Western Blotting 1:1000 Immunoprecipitation 1:50 Immunofluorescence (Immunocytochemistry)

1:100 - 1:400

Supplied in 10 mM sodium HEPES (pH 7.5), 150 mM NaCl, 100 μg/ml BSA and 50% glycerol. Store at -**Storage** 20°C. Do not aliquot the antibody.

KAP-1 Antibody detects endogenous levels of total KAP-1 protein. Specificity / Sensitivity

Source / Purification Polyclonal antibodies are produced by immunizing animals with a synthetic peptide corresponding to

amino acids near the carboxy terminus of human KAP-1. Antibodies are purified by peptide affinity

chromatography.

**Background** KAP-1 is a member of the TIF1 (transcriptional intermediary factor 1) family, a group of transcriptional

regulators that play key roles in development and differentiation. Members of this family are characterized by the presence of two conserved motifs - an N-terminal RING-B box-coiled-coil motif and a C-terminal PHD finger and bromodomain unit (1,2). KAP-1 is a corepressor for KRAB (Kruppel associated box) domain containing zinc finger proteins. The KRAB domain containing zinc finger proteins are a large group of transcription factors that are vertebrate-specific, varied in their expression patterns between species, and thought to regulate gene transcription programs that control speciation (3,4).KAP-1 has been shown to be essential for early embryonic development and spermatogenesis (6,5). It functions to either activate or repress transcription in response to environmental or developmental signals by chromatin remodeling and histone modification. The recruitment and association of KAP-1 with heterochromatin protein (HP1) is essential for transcriptional repression, and for progression through differentiation of F9 embryonic carcinoma cells (6,7). KAP-1 also plays a role in the DNA damage response. Phosphorylation of KAP-1 on Ser824 occurs in an ATM-dependent manner in response to genotoxic stress and is thought to be essential

for chromatin relaxation, which is in turn required for the DNA damage response (8).

Species reactivity is determined by testing in at least one approved application (e.g., western blot). **Species Reactivity** 

IMPORTANT: For western blots, incubate membrane with diluted primary antibody in 5% w/v nonfat dry Western Blot Buffer

milk, 1X TBS, 0.1% Tween® 20 at 4°C with gentle shaking, overnight.
